Introduction

SPROG II is a DCC decoder programmer for connection to the USB port of a personal computer or similar device. SPROG II is supported by DecoderPro and PanelPro, both part of the JMRI project (<u>http://jmri.sourceforge.net/</u>) which, by use of the java programming language, allows platform independent support of a wide range of DCC hardware. The JMRI software is shareware available as a free download.

SPROG II is also capable of operating a small layout using the features of DecoderPro and PanelPro. A larger layout can be driven by using an external booster.

Requirements

- DecoderPro from http://jmri.sourceforge.net/ or the CD-ROM supplied
- Regulated DC Power Supply (see Table 1)
- Short length or small oval of track for programming and/or test running

Features

- Programs virtually all NMRA compliant DCC decoders
- No extra hardware required for programming sound decoders (e.g. QSI, Soundtraxx)
- Easy to use graphical interface with DecoderPro
- USB interface for easy connection to PC
- USB activity LED shows communication with the PC
- Power LED flashes when programming track power is live

Parameter	Minimum	Nominal	Maximum	Units	Note

Output Load –			1	A	3
Operating Layout					

Specification/Operating Conditions

Table 1 Specification/Operating Conditions

Notes:

- 1. Minimum supply voltage depends upon the requirements of the decoder being programmed. In general it is safer to use as low a voltage as possible in case of problems with a newly installed decoder.
- 2. SPROG II will remove track power if output current exceeds 250mA as measured 100ms after applying power. Surge current during decoder power-up may be considerably greater than this.
- 3. Depends upon required DCC current.
- 4. SPROG II is protected against reverse polarity connection of the power supply but will not work unless the polarity is correct.

SPROG II is <u>not</u> protected against track and power connections being interchanged.

Installation

The following steps are required to install SPROG II before you can use it for the first time:

- Install DecoderPro 2.14 or later (Will also install the Java Runtime Environment (JRE) if necessary)
- Connect the Power Supply
- Install SPROG II USB drivers
- Edit DecoderPro preferences
- Connect the Programming Track

This document gives brief installation instructions for the Windows Operating System, versions 2000, XP or 7, or for MacOS 10.4 and newer. For further instructions and for instructions to install the JRE and DecoderPro on Linux, please refer to the Install Guides on the JMRI website at http://jmri.sourceforge.net/download

Install DecoderPro

DecoderPro should be installed from the CD-ROM or a downloaded copy. The CD includes the latest production version at the time of supply.

A newer version of DecoderPro than that supplied on the CD-ROM may be available from the JMRI download page http://jmri.sourceforge.net/download

This user guide assumes you are using version 2.14, or later.

To install from the CD-ROM, browse to the directory specific to your operating system to find the JMRI installer. For example, if your CD-ROM drive is D: on Windows, double click on the file D:\Windows\JMRI.2.14.exe.

Connect the Power Supply

Power supplies packaged with a SPROG II are already connected to the green pluggable terminal block.

For any other supply used, connect as described below.

- Cut off the low voltage DC plug
- Separate the two conductors for about 3cm
- Strip 6-8mm of insulation from each conductor and twist the copper cores of each conductor together

- Insert the positive conductor the +V terminal and tighten the screw
- Insert the other conductor in the 0V terminal and tighten the screw

SPROG II is protected against reverse polarity connection of the power supply but will not work unless the polarity is correct.

The power LED will only illuminate steadily when the SPROG II is powered up *and* the USB is connected to the host computer (next step).

The power LED will flash when the programming track is powered up.

Install SPROG II USB drivers

Use the supplied USB cable to connect SPROG II to the host computer. The power LED should be lit.

There are four possible choices set out below, for earlier Windows systems, Windows 7, MacOS 10.4 and later, or Linux. Select the right section for your computer and operating system.

Drivers for Windows 2000, XP or Vista (with some variations)

The first time you connect the SPROG you should see the "Found new Hardware Wizard". Follow the steps below to install the SPROG II drivers.

Click "No, not this time" then click "Next >".

Click "Install from a list or specific location" then click "Next >".

Found New Hardware Wizard
Please choose your search and installation options.
⊙ Search for the best driver in these locations.
Use the check boxes below to limit or expand the default search, which includes local paths and removable media. The best driver found will be installed.
Search removable <u>m</u> edia (floppy, CD-ROM)
✓ Include this location in the search:
E:\SprogDCC\doc\SoftwareDisc\USB\sprogllv3\inf 🖌 🛛 Browse
Don't search. I will choose the driver to install.
Choose this option to select the device driver from a list. Windows does not guarantee that the driver you choose will be the best match for your hardware.
< <u>B</u> ack <u>N</u> ext > Cancel

Click "Search for the best driver in these locations" then "Include this location in the search" and then click the Browse button to find the driver directory on the CD-ROM supplied with SPROG II.

If your CD-ROM drive is E:, for example, this directory will be E:\USB\sprogIIv3\inf

Click "Next >".

The base drivers are fully compatible with WindowsXP. To make them SPROG II specific, the .inf files are edited which, unfortunately, causes this dialogue to appear.

Click "Continue Anyway" and wait for the installation to complete.

Identify the connection Port

The next step is to ascertain which COM port was assigned to SPROG II during the driver installation. Open the System Properties from the Windows Control Panel (you may need to switch to classic view in Control Panel). Alternatively, right click on the Desktop "My Computer" Icon and select Properties.

Select the Hardware tab:

stem Pro	perties			?
Syster	n Restore	Automa	tic Updates	Remote
General	Comp	uter Name	Hardware	Advanced
-Device I	Manager The Device N on your comp properties of a	fanager lists all uter. Use the D any device.	the hardware device evice Manager to ch	es installed hange the
-Drivers-	Driver Signing compatible wi how Windows	g lets you make th Windows. W s connects to W	sure that installed dr indows Update lets	ivers are you set up drivers.
	Driver	Signing	Windows L	Jpdate
Hardwar	e Profiles Hardware pro different hard	files provide a v ware configurati	vay for you to set up ons.	and store
			Hardware	Profiles
		ОК	Cancel	Apply

Click "Device Manager"

🗏 Device Manager 📃 🗖	
<u>File Action View H</u> elp	
 Keyboards Mice and other pointing devices MicrochipTools Monitors Monitors Network adapters Ports (COM & LPT) SPROG IIv3 (COM7) Sound, video and game controllers Storage volumes System devices Universal Serial Bus controllers 	
	~

Click the "+" to open the Ports (COM & LPT) category and note the COM port assignment for the SPROG II (COM7 in this example).

Your install steps are now all completed, and it is time to start the software and use your SPROG II. Go on to the next major section of this Guide "Setting Preferences".

Driver Installation for Windows 7

When the SPROG IIv3 is first plugged into a USB port you should see a bubble appear in the lower left corner of the screen "Installing device driver – click here for status". If you click then a further status window opens.

The driver installation will not succeed at this point and you will ""Device driver software was not successfully installed" in a bubble in the lower left of the screen or the status window:

Driver Software Installation				
Device driver software was not successfully installed				
Please consult with your device manu	facturer for assistance getting this device installed.			
SPROG IIv3 DCC Programmer	🗙 No driver found			
What can I do if my device did not inst	tall properly?			
	<u>Close</u>			

Click "Close"

Open the Device Manager (Start -> Control Panel -> Device Manager) and expand the display of "Other device" where you should see the SPROG IIv3:

Point to the SPROG DECODER PROGRAMMER entry and press the Right mouse button. Select "Update Driver Software", or select Properties, and under the Drivers tab, click "Update Drivers".

13

Ηον	w do you want to search for driver software?	
•	Search automatically for updated driver software Windows will search your computer and the Internet for the latest driver software for your device, unless you've disabled this feature in your device installation settings.	
•	B <u>r</u> owse my computer for driver software Locate and install driver software manually.	

Click "Browse my computer for driver software", and then click the Browse button to find the drivers on the CD-ROM supplied with your SPROG II. If your CD-ROM drive is D:, for example, browse to the directory D:\USB\sprogIIv3\inf, as shown:

(Mute Lock Power Plan Slee
	Browse for driver software on your computer
	Search for driver software in this location:
	D:\USB\sprogIIv3\inf
	Let me pick from a list of device drivers on my computer This list will show installed driver software compatible with the device, and all driver software in the same category as the device.
	Next Cancel

Check the "Include subfolders" box.

Click the "Next" button.

The wizard will take a short time to find and verify the drivers in this location. You will then see a warning window similar to this:

The base drivers are fully compatible with Windows7, and those supplied on the CD are the latest drivers. To make them SPROG II specific, the .inf files are edited which, unfortunately, causes this dialogue to appear.

Click "Install this driver software anyway".

Click "Close".

Now return to the Device Manager, and the entry will have changed. The SPROG IIv3 will be listed under "Ports (COM & LPT)":

Make a note of the COM port assignment (COM5 in the example above) and close the device manager and control panel windows.

Driver installation is now complete, and it is time to start the software and use your SPROG II. Go on to the next major section of this Guide "Setting Preferences".

Driver Installation for MacOS

TBD

Driver Installation for Linux

For Linux, there are many variations of Linux system installations, and variations in installing the USB support will be encountered. For recommendations and many helpful supporters, see the Linux Support pages on the JMRI website.

Setting Preferences

Now start DecoderPro by double clicking the icon that was placed on the Windows desktop during the installation.

Assuming this is the first time that you have started DecoderPro, you will see a small startup window in the centre of your screen, and then several other windows will be opened. We want to go to the Preferences window.

۳ 🛤)eco	derPro						- 🗆 🗙

				Help	Quit			

If the Preferences window is not there, Open the Edit -> Preferences dialog from the menu; below is the Preferences window from JMRI 2.10 onwards:

Window Help	
Connections Defaults File Locations Start Up Display Messages Roster Throttle WiThrottle	SPROG + System manufacturer: SPROG DCC
	System connection:
	Serial port: COM3
Save	Delete Connection

Click the arrow in the **System manufacturer** field and scroll down to select **SPROG DCC**.

Then in the **System connection** field, select **SPROG** (not SPROG Command Station just yet!)

Click the arrow in the **Serial Port** field and select the COM port noted during driver installation.

Do not select any other fields at this time.

Click "Save" at the lowest left of the window.

Quit no	w? 🔀
?	Your updated preferences will take effect when the program is restarted. Quit now?
	Yes No

Click "Yes". DecoderPro will save the new settings and exit.

Connect the Programming Track

- The programming track MUST be isolated from all other DC or DCC
- control systems and connected only to the SPROG II. Damage may
- result to the SPROG II or other equipment if this rule is not followed.

Connect the SPROG II to the programming track using the "Track" terminals of the pluggable terminal block. There is no requirement to observe any particular polarity when connecting the programming track. The DCC output voltage will be approximately 1V below the power supply voltage, typically about 11V with the standard power supply provided..

During programming the track current is sensed 100 milliseconds after the programming track is powered up. If the current exceeds 250 milliAmps then the programming track power is removed to avoid potential damage to an incorrectly installed decoder.

Getting Started With DecoderPro

See the DecoderPro website <u>http://jmri.sourceforge.net</u> for any updates and latest information.

Join the JMRI Yahoo group <u>http://groups.yahoo.com/group/jmriusers</u> for help from other DecoderPro users and the team who develop it.

Ensure that all software and drivers are installed and that DecoderPro preferences have been setup in accordance with the previous steps.

Start DecoderPro. The main window will open and show the current connection method. This merely reflects the preferences setting and does not actually indicate a physical connection. In the following example "Connected via SPROG on COM4":

Click "Service Mode (Programming Track) Programmer" to open the Programmer Setup window. A new window will pop up which shows a list of decoder manufacturers.

Clicking the control or double clicking the folder icon next to a manufacturer name will open a list of decoder types from that manufacturer. You can always manually select a decoder type in this way. In most cases, DecoderPro can determine the manufacturer and decoder type automatically.

Place a decoder equipped loco on the programming track and click on "**Read type from decoder**". In the example below, DecoderPro has identified a QSI Industries BLI F7. Sometimes DecoderPro can identify the manufacturer but not exact model of decoder fitted. This is because the vendors often use the same readable ID version for multiple similar decoders. Often the difference is in a physical fit, for an SD60 having a different shape from an AC44, or for

21

a set of specific sounds for a different railroad; these do not affect the programming, and so they use a common number for that whole series of models. In these cases it will be necessary to select the decoder type manually, often from several highlighted possibilities.

Once the decoder type has been selected, click "Open Programmer".

The service mode programmer window opens with a selection of "tabs", grouped in rows below the menu bar, Clicking on a tab selects a group of CVs to be programmed, related to the title of the tab. The selection of tabs available will vary depending upon the features supported by your decoder and the CVs available.

On the "Roster Entry" tab you may enter arbitrary details of the loco to be saved on the PC for future reference. You need to enter a unique name in the top box (initially marked <new loco>) as this will be the name of a file in the Roster with all the settings for this loco. The road number is often a good

23

choice.

Everything else on this pane is optional, and for your convenience. The DCC address field will be filled in by DecoderPro once the decoder has been read or programmed. If you wish to use the Roster then you should make sure to click "Save" on the Roster Entry tab when you have finished programming the decoder. The Roster is especially useful if the decoder loses its settings as seems to happen occasionally with some decoders. Alternatively, you may wish to program a second loco with similar CV settings.

🚆 Program <new< th=""><th>v loco > in Servic</th><th>e Mode (Progi</th><th>amming i</th><th>Frack)</th><th></th><th></th><th></th><th></th></new<>	v loco > in Servic	e Mode (Progi	amming i	Frack)

	Deco	der Model:	BLIF7					
	Deco	aci comment.						
	Cil		•				•	
	Filend	ime:		Save]			
				Reset to defa	ults			
	Read changes o	n all sheets	Write	hanges on all sh	eets	Read all sheets	Write all s	heets
			Direct bit	mode programm	ing s	Set		
				idle				

Note on 'ID:' When you click Save, the ID will become the file name of the roster entry created for this loco, and also the entry in the list for you to be able to select a previously-programmed and saved loco in future, by using the **Ident** button.. Name these entries wisely!. Many people use the loco type and number, or Operator/road name and number, but choose a system that will be meaningful to you.

Click on the "Basic" tab and you will see the most essential settings for the decoder including the address. Initially, all of the data fields are coloured red or yellow to show that no data has been read from or written to the decoder. There are eight read and write buttons at the bottom of the window. Click "Read full sheet" to read the data for the current tab from the decoder. That will read CVs 1, 29, 17, 18, 19, 7, 8, 105 and 106 and fill in these values from the loco.

Clicking "Read all sheets" will read every CV from the decoder and may take a considerable time to complete.

嘴 Program <nev< th=""><th>v loco> in Service</th><th>Mode (Progr</th><th>amming Tra</th><th>ck)</th><th></th><th></th><th></th><th></th></nev<>	v loco> in Service	Mode (Progr	amming Tra	ck)

	Read changes or	all sheets	Write cha	nges on all sheets	s Re	ad all sheets	Write all	sheets
			Direct bit mo	de programming	Set.			
				idle				

Each data field should return to white or the background colour of the window.

Check that you see what you expected, especially if you are reading a decoder that was already programmed elsewhere!

The exact look and layout of these programming panes may vary as versions of DecoderPro or the specific decoder types are updated, but the essential information and capabilities remain consistent.

To change the locos address, type a new address in the Active DCC Address followed by carriage return. The address field will turn orange, indicating that the address has been changed but not yet written to the decoder. Select the type of address to be set (short or extended).

嘴 Program <ne< th=""><th>v loco> in Service</th><th>e Mode (Progr</th><th>amming Track)</th><th></th><th></th><th></th></ne<>	v loco> in Service	e Mode (Progr	amming Track)			
File Reset

	Read changes or	n all sheets	Write changes on all sl	ieets Read all st	neets Write a	II sheets
			Direct bit mode programn	ning Set		
			OK			

Click "Write changes on sheet" to write the new address to the decoder. The address will turn red and then white as it is written to the decoder. You can set other basic properties such as the direction and DC operation on this tab.

To Save your data to the Roster record on your computer, either pick from the menu bar at the top of the screen, or go back to the first pane where there is a "Save to Roster" button.

The other tabs work in a very similar way. You may find it useful to have the decoder documentation available when setting more complex or manufacturer specific features.

Next we'll look at the Speed Control tab that allows you to fine tune the way the loco responds to the throttle. Click on the "Speed Control" tab.

The decoder in this example has a choice between "Use Straight-Line response" and "Use QSI table or User table in CVs 67 through 94". The "look and feel" of this tab will vary between decoders but most recent decoders support the use of a speed table.

It is left as an exercise for the reader to experiment with the sliders for setting the speed table and the buttons just below. The "Force Straight" option will give a linear relationship between the throttle position and the speed of the loco. "Constant ratio curve" will give little change in speed at low throttle settings, greater change at higher throttle.

Remember to write the changes on each sheet before moving to a new one.

Next, click on the "Function Map" tab.

The Function Map allows you (in those decoders that support it) to control which throttle function key is mapped to each output wire or operation (e.g. sound effect) of the decoder.

🛣 Program <new loco=""> in Service Mode (Programming Track) 📃 🗖 🔀</new>

					ОК				

Again, remember to write your changes.

Hovering over an item with the cursor will often show a short description for that item, but it is highly recommended that you read the documentation for your decoder to get the best from it with DecoderPro.

Using the DecoderPro Throttle

Using a DecoderPro throttle, it is possible to test run a loco after programming CVs, e.g., to test the effect of changing the speed table of function mapping. Using a rolling road or a continuous loop of track for programming is recommended for test running.

Using PanelPro and the throttle, it is possible to control a small "one engine in steam" layout, including control of accessories (e.g. point motors) with SPROG II. More than one loco may be present on the layout but only one may be selected on the throttle and driven at one time.

Care should be taken when using the service mode programmer that only one loco is on the layout during programming, or that the layout is isolated except for a short section of track for programming. If a programming operation is performed whilst the whole layout is connected, then incorrect data will be read from CVs and all locos on the layout will be re-programmed.

On the main DecoderPro window, click on the "Tools" menu item and then select "Throttles" and "New Throttle..."

		Speed	ometer	•				
		Light (Control					

SPROG II, when used as a programmer, supports the use of one DecoderPro throttle. See "Layout Control with SPROG II" for details of how to use SPROG II as a command station with multiple throttles.

When the throttle window opens, enter the loco address and click "Set".

With SPROG II, loco addresses less than 128 are assumed to be short (2

```
Version 1.7 January 2012
```

digit) addresses. Addresses greater than 127 are assumed to be extended (4 digit) addresses.

Setting the loco address will enable the function buttons and speed slider.

The Power icon on the right of the menu bar is the track power control and must be clicked until it is green to turn on the track power. The SPROG II power LED will flash when the track power is live.

Note: After programming using the service mode programmer, the track power is always left in the off state and must be turned on again from the throttle power control before the loco can be run.

The function keys mostly have a latching operation. Click once to turn a function on, click again to turn the function off.

To control the loco speed, click and drag the slider caret (the pointy bit!). For fine control of speed, click on the slider just above or below the caret.

The "STOP!" button will stop the loco but does not turn off the track power.

To set a different loco address, click the "Dispatch" or "Release" button. These two buttons have the same effect with SPROG II.

Speed Matching of Locos

To come in a future release of this document...

Measuring Loco Current

Loco current may be measured by using SPROG II in command station mode and using the slot monitor, see "Layout Control with SPROG II".

Getting Started With PanelPro

The PanelPro tool included with JMRI allows SPROG II to be used for the control of DCC accessory decoders for point (turnout) control.

The limited output voltage and current capability of SPROG II means that it is not suitable for use with accessory decoders that take power from DCC. Accessory decoders should be chosen that take commands from DCC but use a separate power input for the point motors.

This is only a very brief introduction, see the PanelPro homepage at <u>http://jmri.sourceforge.net/apps/PanelPro/PanelPro.html</u> for more details.

On the main DecoderPro window, click on the "Panels" menu item and then select "New Panel..."

Panel items can be repositioned						
Panel items control layout						
Panel has menu						

A blank Panel and the Panel Editor window will open

You can set the panel name to be used when saving the panel. Use the File menu in the panel editor to save the panel.

You can draw a background track plan in a graphical editing tool and then load the image as the background for the panel. It may take some experimenting to get the track spacing correct to match the panel icons.

To add a turnout, click in the box next to the "Add right/left-hand turnout" button. Enter the accessory address of the turnout and click the appropriate "Add" button. A turnout icon will be added to the panel. The icon may be repositioned by clicking and holding the right mouse button and dragging the icon to its new position. In the example below, a right-hand turnout has been added and moved. The pop-up menu shows the accessory address prefixed with "ST" for "SPROG Turnout". The turnout may be rotated, disabled or removed using the same menu.

嘴 Pa	anel		_ 0 >	<
Edit	Help			_
		\mathbf{r}		
		<u> </u>	ST1	
			Rotate	
			🗆 Disable	
			Remove	

Clicking the "Add icon" button will add a straight track section

In the next step two straight line segments and a left hand turnout (address 2) have been added and aligned to represent the layout of a passing loop.

Left clicking on a turnout icon will change the icon and send the appropriate DCC accessory command to change the turnout on the layout. Here, both turnouts have been clicked to select the route into and out of the passing loop.

The track power must be on for any accessory commands generated from the panel to be effective.

Layout Control with SPROG II

SPROG Command Station Mode

A feature in DecoderPro versions from 1.9.2 onward is the ability to use SPROG II as a command station with control of multiple locos through on screen throttles.

When operating in this mode, SPROG II is no longer a service mode (programming track) programmer. CVs may still be written in operations mode (also known as "on the main" programming) but the contents of CVs cannot be read back.

To use SPROG II as a command station, you must first modify the DecoderPro preferences in a similar manner as was done during initial installation of the SPROG II.

Open the Edit -> Preferences dialog from the menu

|--|

Window Help	XF

Roster Throttle WiThrottle	System connection:	SPROG ▼ (none selected) SPROG	
	Serial port:	SPROG Command Station COM3	ings
		Additional Connection Sett	Delete Connec

Click the arrow in the System connection field and scroll down to select "SPROG Command Station".

Click "Save"

Quit no	Quit now?					
?	Your updated preferences will take effect when the program is restarted. Quit now?					
	Yes No					

Click "Yes". DecoderPro will save the new settings and exit.

Start DecoderPro again. You may now open multiple throttles, one for each loco you wish to control. See below for a note on the limit to the number of locos that can be controlled.

Use the power control in any of the throttles to turn the track power on or off.

An additional feature in Command Station mode is the slot monitor which is accessed from the SPROG menu in the main DecoderPro window

38

	Help Quit								

The top portion of the slot monitor contains a checkbox to control whether unused slots are displayed, a button to force an emergency stop of all locos and the output current being supplied by the SPROG II.

The output current reading will not reflect the layout current if an external booster is being used.

The output current readings are filtered and averaged over a number of readings by SPROG II and the display in the slot monitor will change more slowly than the actual output current.

The remainder of the slot monitor is the list of slots, at least one slot is associated with each throttle (see below).

🖆 SPROG Slot Monitor 📃 🗖 🔀							
	2	Show unus	sed slots	estop all	lout: 0.163	A	
Slot		Address	Speed	Use		Consi	Dir
0	E Stop	997	35	In Use	Free	≺n/a≻	R
1	E Stop	1	43	In Use	Free	≺n/a>	F
2	E Stop	0	0	Free	Free	≺n/a>	F
3	E Stop	0	0	Free	Free	≺n/a>	F
4	E Stop	0	0	Free	Free	≺n/a>	F
5	E Stop	0	0	Free	Free	≺n/a>	F
6	E Stop	0	0	Free	Free	≺n/a>	F
7	E Stop	0	0	Free	Free	≺n/a>	F
8	E Stop	0	0	Free	Free	≺n/a>	F
9	E Stop	0	0	Free	Free	≺n/a>	F
10	E Stop	0	0	Free	Free	≺n/a>	F
11	E Stop	0	0	Free	Free	≺n/a>	F
12	E Stop	0	0	Free	Free	≺n/a>	F
13	E Stop	0	0	Free	Free	≺n/a>	F
14	E Stop	0	0	Free	Free	≺n/a≻	F
15	E Stop	0	0	Free	Free	≺n/a>	F

In this example, SPROG II is supplying 163mA to the layout. A loco with address 997 is running in reverse at speed step 35 and a loco with address 1 is running forwards at speed step 43

When you use a function button on a throttle, you will see an extra slot occupied momentarily with the address of the loco on that throttle and speed 0. This indicates that the function command is being sent to the loco. To allow for errors in reception, function commands are repeated three times. After the third copy is sent, the slot will be cleared.

Short (one byte) Versus Extended (two byte) Addressing

The DCC specification allows two forms of loco address:

- Short addresses in the range 1 127
- Extended addresses in the range 1 10239

Most DCC system impose their own arbitrary limits on these address ranges. In SPROG Command Station mode the allowable address ranges are:

- Short addresses TBD...
- Long addresses TBD....

How Many Locos Can Be Controlled?

Sixteen slots are available, but SPROG II is not capable of powering sixteen locos without an external booster.

Run each loco individually with a representative load and note the current reading. The total required for your layout will depend upon the "diversity" or how many, and which, locos are to be operated at the same time.

It should be possible to run at least 3 or 4 modern HO, 00 or N lightly loaded locos.

Some slots should always be left free for sending function control commands. These free will be shared between throttles as required, it is not necessary to have a free slot for every throttle.

Using an External Booster with SPROG II

Please consider the SPROG DCC SBOOST, a 2.5A booster that is designed specifically for use with the SPROG family of programmers.

Connecting and Using Multiple SPROG IIs

At the present time it is not possible to use the alternate connection method in DecoderPro to connect a second SPROG II.

It is, however, possible to run two (or more) separate instances of DecoderPro connected to two (or more) SPROG IIs, e.g.

One SPROG II in command station mode running the layout

One SPROG II in normal or command station mode running PanelPro to control accessories

One SPROG II in normal mode connected to a programming track

If used this way, the programming track should be wired via a DPDT switch so that it can be connected to the main layout (to allow locos to be driven on to it) or connected to the SPROG II programmer, not both at the same time.

Never connect more than one SPROG II or a SPROG II and any other DCC booster or DC controller to the same section of track.

Determining the SPROG II Firmware Version

Select "Get SPROG Firmware Version" from the SPROG menu

The SPROG firmware version will be displayed in a new window.

Click "OK" to close the window.

The SPROG Console

The SPROG console allows optional SPROG features to be enabled and disabled. Select the SPROG Console from the SPROG menu

Save								

Title Bar

The title bar includes the type and firmware version of the connected SPROG, e.g SPROG II USB v2.5.

Command History

The command history pane provides the same functionality as the basic Command Monitor (available on the SPROG menu) and captures commands to and replies from the SPROG. The history may be saved to a file on the computer by first choosing a log file and then selecting "Start logging". The command history can be useful in diagnosing problems encountered in using the SPROG.

The "Add Message" field can be used to add annotations to the command history.

Send Command

The "Send Command" field provides the same functionality as the basic Send command utility available on the SPROG menu. Enter a command in the Command field and press return on the keyboard or click the send button to send the command to the SPROG.

Selecting SPROG Operating Modes

After changing any of the following modes, you should use the "Save" button to store the changes in the SPROG.

Speed Step Modes

Choose the speed step mode to be used by the SPROG throttle. The default is 128 step, which is recommended for all recent DCC decoders.

Current Limit

Set the current limit for the SPROG track output when using a SPROG throttle, or when connected in Command Station mode. The maximum current limit is 996mA or 0.996 Amps.

Set ZTC Mode

Some older ZTC decoders cannot be reliably programmed on some systems, even though they conform to the DCC standards. Select this option to configure SPROG for programming these decoders. It should still be possible to program other decoders with this mode enabled. If in doubt, disable this mode by de-selecting the tick box.

Set Blueline Mode

Blueline decoders use a slightly different interpretation of the DCC standards for direct mode programming to that normally assumed by SPROG. Select this option to configure SPROG for programming Blueline decoders in direct mode.

It will still be possible to program most other decoders with this mode enabled, but reading CVs from the decoder will be slower. If in doubt, disable this mode by de-selecting the tick box.

Unlock Firmware

Select this option if you are about to update the SPROG firmware using the bootloader. This mode is automatically canceled when the power is removed from the SPROG.

Save

Always click this button after selecting a new mode. The selected modes (apart from "Unlock Firmware") will be stored in the SPROG, so that they are effective each time you use your it, even after the power has been removed.

Updates to the SPROG II Firmware

The "firmware" is the small computer program that runs on the microprocessor at the heart of the SPROG. Occasionally it becomes necessary to update the SPROG firmware to add new features or fix bugs.

The SPROG DCC philosophy is that all versions of SPROG, whether SPROG or SPROG II, USB or serial are totally forwards and backwards compatible and that any new features and bug fixes are made available to all existing users.

The firmware can be updated by returning your SPROG to SPROG-DCC (or appointed representative) or, for some SPROG versions, by using the "bootloader" (see below).

Returning Your SPROG for Update

If your version of SPROG does not support the bootloader then please contact us to discuss returning it for update. This is usually free of charge but return postage is always appreciated. To avoid a large workload, please only request an upgrade if you are sure you require it, e.g. for programming QSI sound decoders.

Firmware Update Using the Bootloader

Currently, the bootloader is only supported on USB SPROG IIs with firmware version 2.4 and above.

The "bootloader" is a feature of SPROG that allows new firmware to downloaded to the SPROG via the normal USB connection.

Before proceeding, please download and install DecoderPro version 2.12, or later and ensure that your SPROG is firmware version 2.4 or later (see "Determining the SPROG II Firmware Version").

Download the new firmware (if available) as a .hex file from the SPROG-DCC website and save it in a convenient place on your computer.

If the bootloader download is interrupted for some reason (e.g. if power or USB connection are removed), the SPROG may be left in an unusable state. In this case it will need to be returned for repair.

Follow the step-by-step instructions to download the new firmware:

- 1. Open the SPROG console in DecoderPro (see "The SPROG Console").
- 2. Tick the "Unlock firmware" selection by clicking with the mouse.

- 3. Click "Save" and close the Console.
- 4. Select the "SPROG II/SPROG 3 Firmware Update" utility from the SPROG menu.

Click "Update" if you have the new firmware file available and are ready to

SPROG	SPROG II Firmware Update 🛛 🔀						
In order to proceed with a SPROG II firmware updateYou must have a valid .hex firmware u Are you certain you want to update the SPROG II firmware?							
	Cancel Update

Troubleshooting

Before reporting any problems please check the SPROG II homepage for any bug reports or updates. There is a SPROG II FAQ page which will be updated to reflect the most common questions people have about SPROG.

One common problem is the configuration of the "Virtual COM Port" for USB SPROGs. Please review the information in the section "Edit DecoderPro Preferences".

If this is not successful, it is often effective to delete the file containing the Preferences settings. This file is in the user's data area on the computer and is named **DecoderProConfig2.xml**.

On any computer, this is stored in the user's data area, in the JMRI folder. Be sure that DecoderPro is not running, locate and delete this file, and then start DecoderPro once more. Set preferences as before, and restart DecoderPro.

If you are experiencing intermittent faults with your SPROG, please ensure that you are using a good quality DC, regulated power supply.

If you have problems with programming a decoder, or operating DecoderPro throttles, for instance, please use the SPROG console (found under the SPROG menu in DecoderPro), recreate the problem and send the output of the command monitor to sprog@sprog-dcc.co.uk or (for North American customers) <a href="mailto:sprog@spro
