

# ADS LED output driving a bicolour LED via two leads

The same principle applies to the ADS-8sx

Resistor values are indicative – adjust for brightness but never less than 1kΩ

The ADS LED output is about 4V and these Alpha Mimic Dual Red+Green LEDs operate at about 2V. Commercially available model signals may have higher voltage requirements (i.e. a built-in resistor) and so this method may not work.
